Iron Age vs. Cloud Age

| Iron Age | Cloud Age |
|---|---|
| Cost of change is high | Cost of change is low |
| Changes represent failure (changes must be “managed,” “controlled”) | Changes represent learning and improvement |
| Reduce opportunities to fail | Maximize speed of improvement |
| Deliver in large batches, test at the end | Deliver small changes, test continuously |
| Long release cycles | Short release cycles |
| Monolithic architectures (fewer, larger moving parts) | Microservices architectures (more, smaller parts) |
| GUI-driven or physical configuration | Configuration as Code |

@cjkodare

“
Infrastructure as Code is a
Cloud Age approach to
managing systems that
embraces continuous change
for high reliability and quality.

/jonahandersson

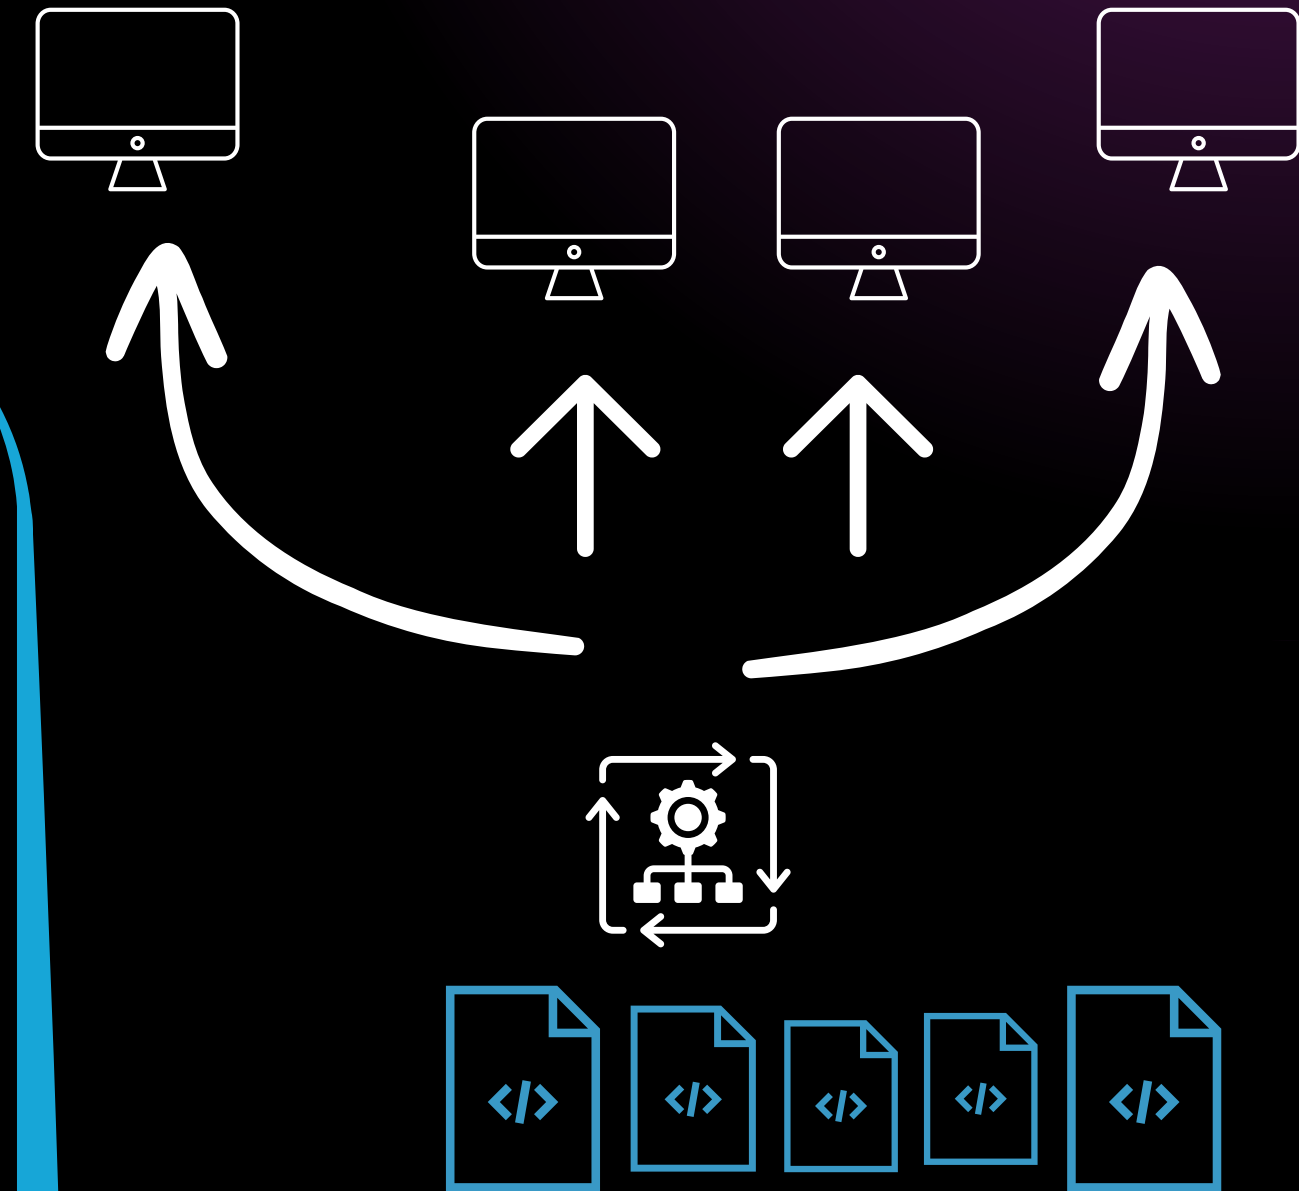

@cjkodare

IaC - The Definition

Infrastructure as code (IaC) tools allow you to **manage infrastructure** with configuration files rather than through a graphical user interface.

IaC allows you to **build, change, and manage your infrastructure in a safe, consistent, and repeatable way** by defining resource configurations that you can version, reuse, and share"

Benefits of Infrastructure as Code (IaC)

- Process automation
- Declarative Paradigm
- Repeatable Deployments
- Easier to scale out/in, configure and change when needed
- Enforce compliance best practices
- Collaboration between teams (DevOps, Dev, etc)
- Help solve the rising complexity of cloud and architecture

Infrastructure as Code (IaC)

Azure Functions

Managed Identities

Terraform on Azure

Terraform (Hashicorp)

- An open-source IaC (Infrastructure-as-Code) tool
- Used for cloud infrastructure provisioning, automation and management
- Codifies infrastructure in configuration files that describe the desired state for your topology.
- Multicloud support - public, private clouds, and even SaaS services using Terraform providers.

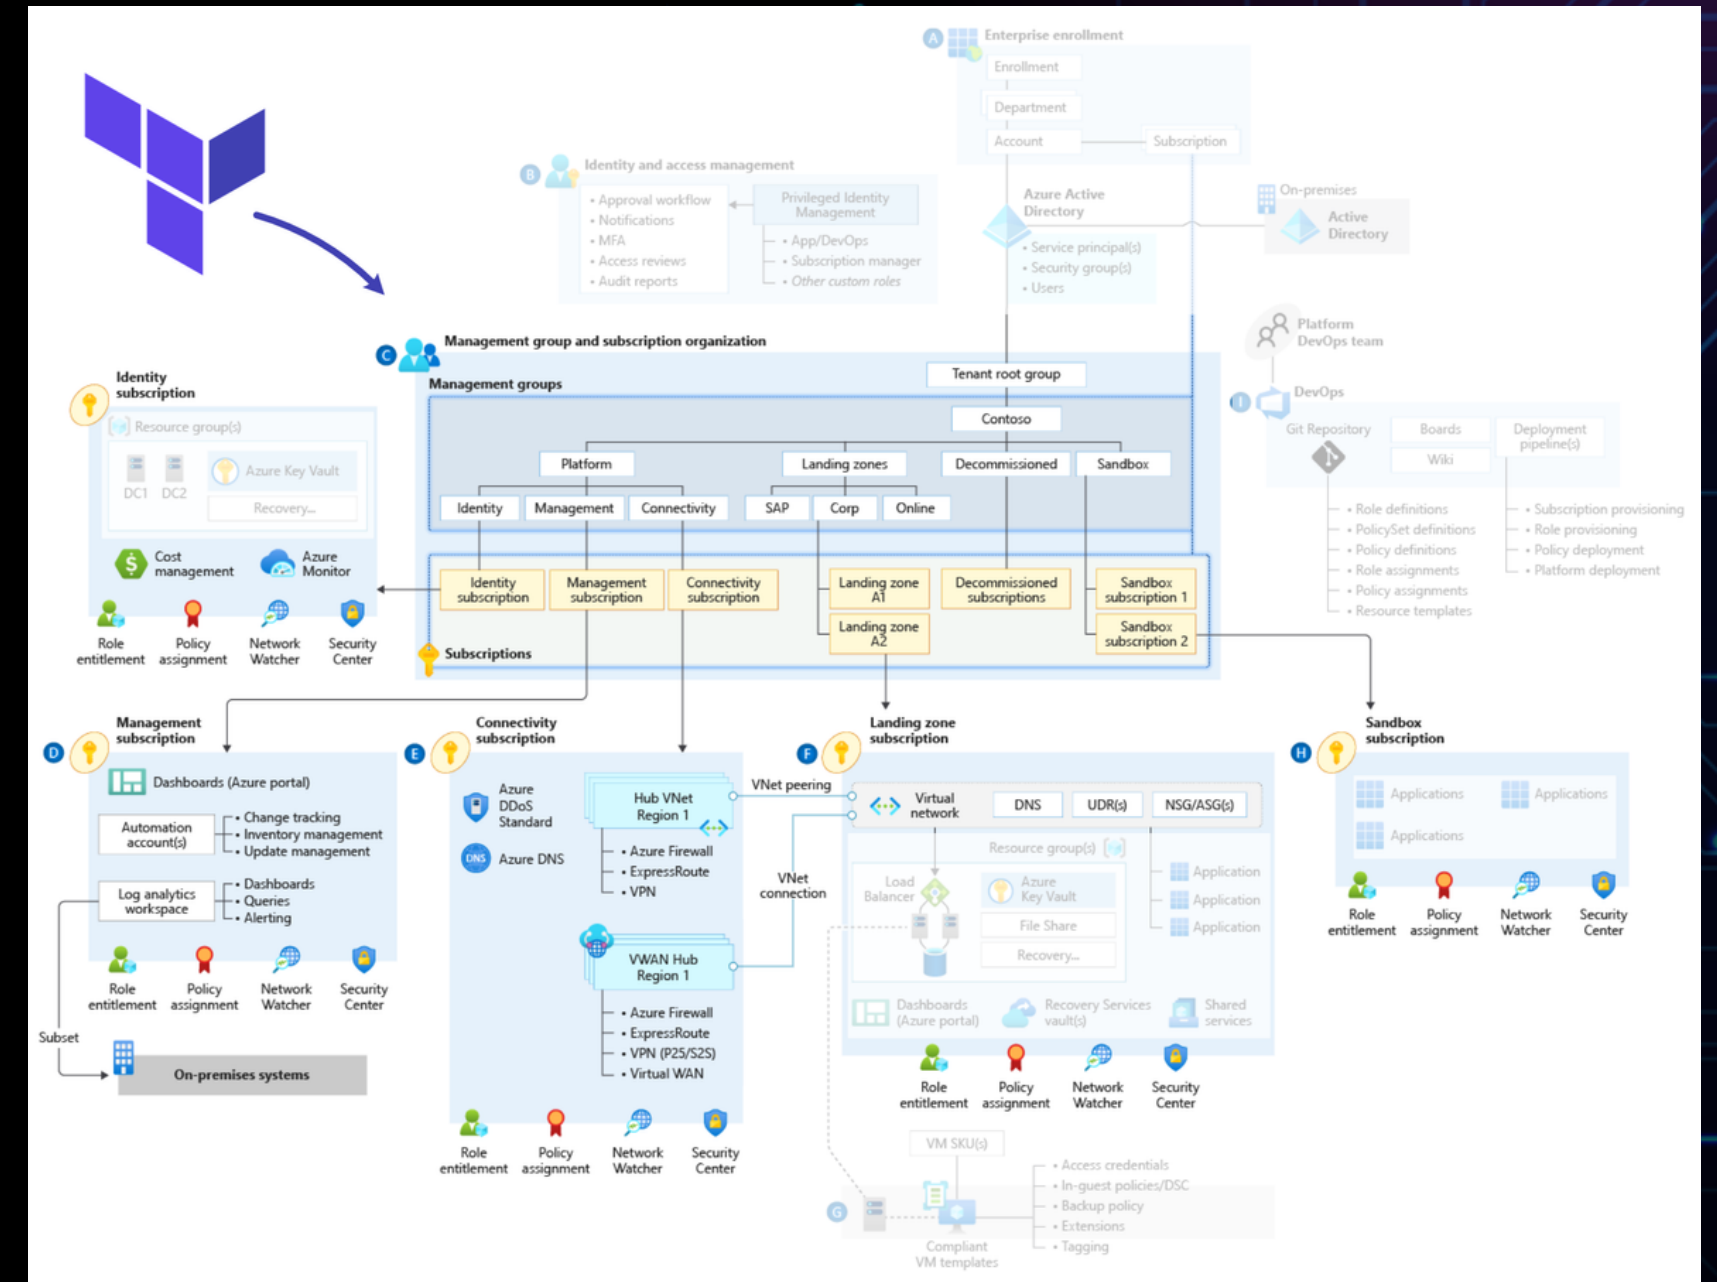

/jonahandersson

@cjkodare

Terraform on Azure

- Automate infrastructure management
- Provision core Azure platform capabilities (ex. CAF on Terraform)
- Provision Azure DevOps pipelines to automate regular infrastructure and application deployments.
- Provision Azure resources

<https://github.com/Azure/terraform-azurerm-caf-enterprise-scale>

/jonahandersson

@cjkodare

Terraform Workflow

①

- **Write** - Author infrastructure as code.
- **Plan** - Preview changes before applying.
- **Apply** - Provision reproducible infrastructure.

Azure Functions

Managed Identities

Terraform on Azure

/jonahandersson

@cjkodare

Azure Functions

- Service Compute Solution in Azure
- Allows write less code and be effective
- Maintain less infrastructure
- Event-driven apps and architecture
- Extension: Azure Durable Functions - Code Stateful Workflows/Orchestration of events by code

A Few Common Problems & Scenarios #1

Developers using their own PAT / tokens and credentials to access, develop or manage resources in Azure

/jonahandersson

@cjkodare

A Few Common Problems & Scenarios #2

DevOps Pipelines need to use Service Principals (Azure AD) for Service Connections which is usually using client tokens/secrets that expires

/jonahandersson

@cjkodare

A Few Common Problems & Scenarios #3

Azure resources and Azure DevOps needs to be integrated with other services, 3rd-party apps, APIs, etc.

/jonahandersson

@cjkodare

A Few Common Problems & Scenarios #4

Extra hassle of manually adding, updating, deleting secrets in Azure Key Vault

Note: Azure Key Vault is best solution for storing secrets than putting it hard-coded in your code

/jonahandersson

@cjkodare

Azure AD Identity Objects & Permissions

Types

- Azure AD Users
- Azure Groups
- Enterprise Apps / Applications

Permissions

- RBAC
- Pre-defined roles, etc.
- Management Groups, etc.

/jonahandersson

@cjkodare

Azure - Service Principals

Why Needed?

Serves as Identity Objects for applications for any apps or entity that is not an Azure AD user or groups

Typical Uses

- Service Connections for Azure DevOps Pipelines
- Integration with Azure resources
- Infrastructure as Code (non Azure) eg. Terraform

/jonahandersson

@cjkodare

Azure - Managed Identities (prev. MSI)

Managed identities provide an automatically managed identity in Azure Active Directory for applications to use when connecting to resources that support Azure AD authentication.

Applications can use managed identities to obtain Azure AD tokens without having to manage any credentials.

Quote from Microsoft Docs

/jonahandersson

@cjkodare

Managed Identities Scenario Comparison

Grant storage permissions to Media Services Account

Grant a Media Services Account Key Vault access

Allow other services to access Media Services

Managed Identities - Types

System-Assigned

Associated with an Azure Resource
e.g. Azure VM, App Service, etc.

User-Assigned

An object itself and it can be
configured to access multiple Azure
Resources

/jonahandersson

@cjkodare

Managed Identity - User Assigned

MI1

Azure VM 1

MI1

Azure VM 2

MI1

Azure VM 3

MI1

Azure VM 4

MI1

Same Identity per Azure VM

Managed Identities - System
Assigned

MIS1
